

ConvertLineEndings Documentation

Module name: ConvertLineEndings
Description: Converts line endings to the host operating system's line endings
Author: Joshua Gould (Broad Institute), gp-help@broad.mit.edu
Date: 03/16/04
Release: 1.1

Summary: This task converts the line endings contained in a file to the line endings used by perl on the host operating system.

The use of this task is indicated if the following two conditions are met:

1. The task you would like to run is written in perl.
2. The line endings for your input file are not the same as the line endings of the operating system in which your GenePattern server is running.

References: none

Parameters:

Name	Description	Choices
input.filename:	input filename (any non-binary file format)	
output.file:	Output file with converted line endings	

Return Value:

output file

Platform dependencies:

Task type: Preprocess&Utility
CPU type: any
OS: any
Java JVM level: n/a
Language: Perl
